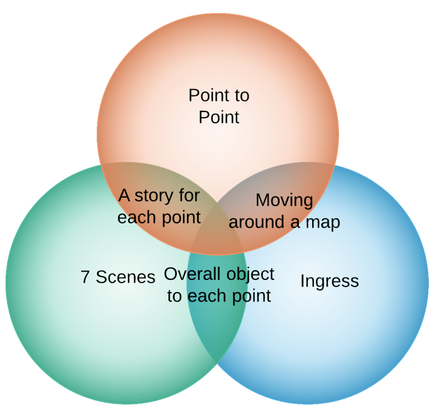
Point to Point
Alessandro Lombardo Jr.

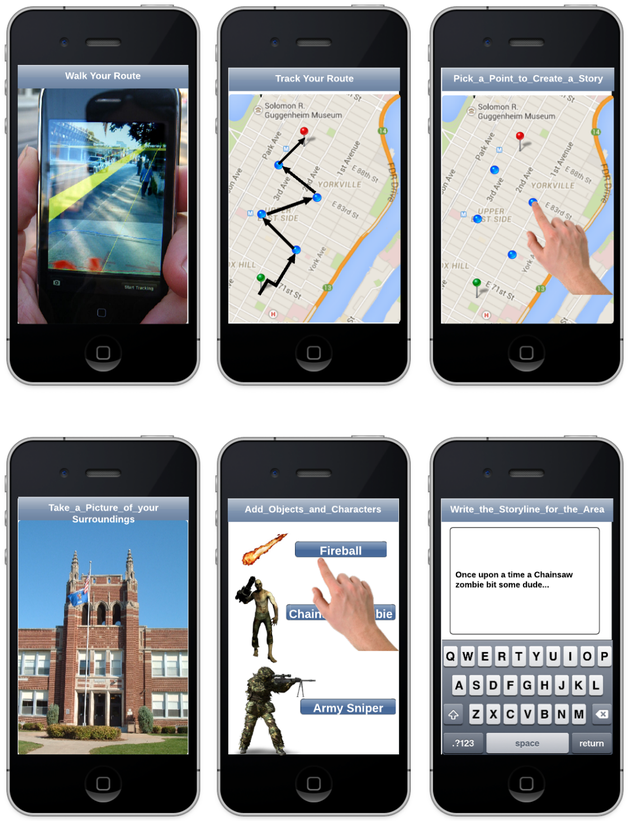
Project Description
Point to Point is a phone application in which the user tracks his or hers route. Along the way they could stop at specific locations and create a story for that location, they can add characters and different scenarios to that location where they are. Then once they finish editing their story, they can upload and share with others. Then others who travel this path can then add on to the story .



Context: ***Describe context or situation in which the problem exists.*** Most story based games require you to play them inside and have no chance to actually change the story line or to come up with your own storyline.

Motivation: ***Describe an incident or condition that motivates the use of the solution.*** Storylines that have been used over and over again and nothing changes about them

Solution: *Show how they access and use the solution to address their need.* Creating an app for the phone that using your location and your ability to tell stories to create a pathway around your hometown to create a storyline that people would enjoy



Outcome: *Describe the outcome of the situation – the payoff, the problem solved, and the happy user.* A fun game that gives people an excuse to go out and tell and hear stories.

User: ***Identify the user, based on the target user group.*** People who like story based games. And who do not want to only play them inside. Tourist who would like to see different sites other than the ones the tour guide is showing
