

Homework

Section 1.9. page 78 Numbers 3-23 (odd)

3. $\mathbb{R}^2 \rightarrow \mathbb{R}^2$ Vertical shear that maps e_1 into $e_1 - 3e_2$ and leaves e_2 unchanged

$$A = \begin{bmatrix} 1 & 0 \\ -3 & 1 \end{bmatrix} [e_1 \quad e_2]$$

5. $\mathbb{R}^2 \rightarrow \mathbb{R}^2$ Rotates counter-clockwise $\pi/2$.

$$A = \begin{bmatrix} \cos\varphi & -\sin\varphi \\ \sin\varphi & \cos\varphi \end{bmatrix}$$

When $\varphi = \pi/2$

7. $\mathbb{R}^2 \rightarrow \mathbb{R}^2$ Rotates through $-3\pi/4$ clockwise and reflects points through horizontal x_1 -axis.

{Hint: $T(e_1) = (\frac{-1}{\sqrt{2}}, \frac{1}{\sqrt{2}})$ }

$$A = \begin{bmatrix} \frac{-1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ 1 & 1 \\ \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{bmatrix}$$

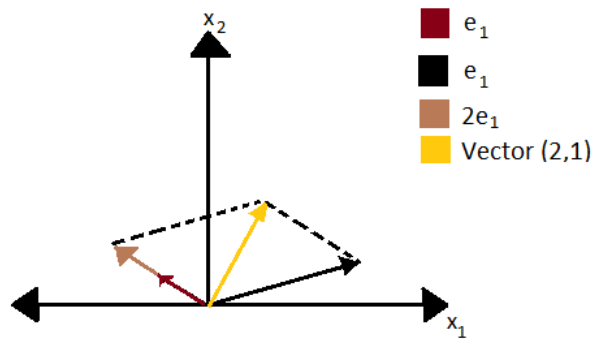

9. $\mathbb{R}^2 \rightarrow \mathbb{R}^2$ Reflects through x_1 -axis and rotates points $\frac{-\pi}{2}$.

$$A = \begin{bmatrix} \frac{-\pi}{2} & 0 \\ 2 & \pi \\ 0 & \frac{\pi}{2} \end{bmatrix}$$

11. $\mathbb{R}^2 \rightarrow \mathbb{R}^2$ Reflects through x_1 -axis then x_2 -axis. Show T can also be described as linear transform that rotates about origin. What is the angle of rotation?

Angle of rotation $\frac{-2\pi}{3}$

13. $T: \mathbb{R}^2 \rightarrow \mathbb{R}^2$. $T(e_1)$ and $T(e_2)$ sketch vector $(2,1)$.

15. Fill in:

$$\begin{bmatrix} 2 & -4 & 0 \\ 1 & 0 & -1 \\ -1 & 0 & 3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 2x_1 - 4x_2 \\ x_1 - x_3 \\ -x_2 + 3x_3 \end{bmatrix}$$

17. $T(x_1, x_2, x_3) = (x_1 - 2x_2, 0, 2x_2 + x_3, x_2 - x_3)$

$$\begin{bmatrix} 1 & 2 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 2 & 0 & 0 \\ 0 & 1 & 0 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} x_1 + 2x_2 \\ 0 \\ 2x_2 + x_3 \\ x_2 - x_3 \end{bmatrix}$$

19. $T(x_1, x_2, x_3) = (x_1 - 5x_2 + 4x_3, x_2 - 6x_3)$

$$\begin{bmatrix} 1 & -5 & 4 \\ 0 & 1 & -6 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} x_1 - 5x_2 + 4x_3 \\ x_2 - 6x_3 \\ 0 \end{bmatrix}$$

21. $T: \mathbb{R}^2 \rightarrow \mathbb{R}^2$. $T(x_1, x_2) = (x_1 + x_2, 4x_1 + 5x_2)$. Find $T(x) = (3, 8)$

$$\begin{aligned} 3 &= x_1 + x_2 & 8 &= 4x_1 + 5x_2 \\ x_1 &= 7 & x_2 &= -4 \end{aligned}$$

$$T(x) = \begin{bmatrix} x_1 + x_2 \\ 4x_1 + 5x_2 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 4 & 5 \end{bmatrix} \begin{bmatrix} 7 \\ -4 \end{bmatrix}$$

Augmented matrix: $\begin{bmatrix} 1 & 1 & 3 \\ 4 & 5 & 8 \end{bmatrix}$ Row reduce $\rightarrow \begin{bmatrix} 1 & 0 & 7 \\ 0 & 1 & -4 \end{bmatrix}$

23. A linear transform $T: \mathbb{R}^n \rightarrow \mathbb{R}^m$ is completely determined by its effect on the columns of the $n \times n$ identity matrix.

True (theorem 10)

If $T: \mathbb{R}^2 \rightarrow \mathbb{R}^2$ rotates vectors about the origin through an angle β , then T is a linear transformation.

True (example 3)

When two linear transformations are performed once on another, the combined effect may not always be a linear transformation.

False

A mapping $T: \mathbb{R}^n \rightarrow \mathbb{R}^m$ is into \mathbb{R}^m if every vector \mathbb{R}^n maps onto some vector in \mathbb{R}^m .

False

If A is a 3×2 matrix, then the transformation $x \rightarrow Ax$ cannot be one-to-one

False
