- Definition: A *sequence* is a function from a subset of the set of integers (usually either the set $\{0, 1, 2, \ldots\}$ or the set $\{1,2,3,\ldots\}$) to a set S.We use the notation a_n to denote the image of the integer n. We call a_n a *term* of the sequence.

- Definition: A *geometric progression* is a sequence of the form a, ar, ar^2,…, ar^n,...

where the *initial term* a and the *common ratio* r are real numbers.

- Definition: An *arithmetic progression* is a sequence of the form a, a + d, a + 2d, . . . , a + nd, . . .

- Definition: A *recurrence relation* for the sequence $\{a_n\}$ is an equation that expresses a_n in terms of one or more of the previous terms of the sequence, namely, $a_0, a_1, \ldots, a_{n-1}$, for all integers n with $n \geq n_0$, where n_0 is a nonnegative integer. A sequence is called a *solution* of a recurrence relation if its terms satisfy the recurrence relation. (A recurrence relation is said to *recursively define* a sequence.

- Definition: he *Fibonacci sequence*, $f_0, f_1, f_2, \ldots$, is defined by the initial conditions $f_0 = 0$, $f_1 = 1$, and the recurrence relation

$$f_n = f_{n-1} + f_{n-2} \text{ for } n = 2,3,4,\ldots.$$

THEOREM 1 If a and r are real numbers and $r \neq 0$, then

$$\sum_{j=0}^{n} ar^j = \begin{cases} \dfrac{ar^{n+1} - a}{r - 1} & \text{if } r \neq 1 \\ (n+1)a & \text{if } r = 1. \end{cases}$$
