

Worksheet 4.3 & 4.4 - Primes and Greatest Common Divisors and Solving Congruences

- Determine whether the integers in each of these sets is pairwise relatively prime.
 - 11, 15, 19
 - 14, 15, 21
 - 12, 17, 31, 37
 - 7, 8, 9, 11
- What are the greatest common divisors and least common multiple of these pairs of integers?
 - $3^7 \cdot 5^3 \cdot 7^3, 2^{11} \cdot 3^5 \cdot 5^9$
 - $11 \cdot 13 \cdot 17, 2^9 \cdot 3^7 \cdot 5^5 \cdot 7^3$
 - $23^{31}, 23^{17}$
 - $41 \cdot 43 \cdot 53, 41 \cdot 43 \cdot 53$
 - $3^{13} \cdot 5^{17}, 2^{12} \cdot 7^{21}$
 - 1111, 0
- Use the Euclidean algorithm to find
 - $\gcd(1, 5)$.
 - $\gcd(123, 277)$.
 - $\gcd(1529, 14038)$.
 - $\gcd(100, 101)$.
 - $\gcd(1529, 14039)$.
 - $\gcd(11111, 111111)$.
- Show that 15 is an inverse of 7 modulo 26.
- Find an inverse of a modulo m for each of these pairs of relatively prime integers.
 - $a = 2, m = 17$
 - $a = 34, m = 89$
- Solve each of these congruences using the modular inverses found in parts (b), of Exercise 5.

$$34x \equiv 77 \pmod{89}$$

7. Use the construction in the proof of the Chinese remainder theorem to find all solutions to the system of congruences

$$x \equiv 1 \pmod{2},$$

$$x \equiv 2 \pmod{3},$$

$$x \equiv 3 \pmod{5},$$

and

$$x \equiv 4 \pmod{11}.$$

8. Use Fermat's little theorem to find $7^{12} \pmod{13}$.
9. Find the discrete logarithms of 5 and 6 modulo 19 to the base 2.
