

- A way to reduce energy consum. & GHG is to properly design, site and shape buildings and use natural heating, cooling, ventilation and daylight.

- Architecture 2030 believe that by 2030 all new buildings will be carbon neutral. very environmental friendly

- two way to reduce building's consumption

one is to work with the environment, the climate in designing, siting and orienting building. using passive heating & cooling systems.

- Secondly increase the ability of a building to capture or generate its own energy from renewable resources.
