

### Abstract

The purpose of this project is to discuss space and why people are interested. It will go over keywords such as "Constellation" and "Astronomy". Space is interesting for many people. The interest can vary from looking at the stars at night, to studying the constellations, to trying to uncover something new about it. Because of this are the various reasons why people are interested in space.

The first reason is curiosity as there are still things unknown about space. The second is discovery, as people want to discover something new and share what they discovered, especially if they were the first to discover it. The third is because, in many cultures, people associate space with the Gods and heaven. Finally, it's for practical uses, as people use the stars from navigation to telling time. An example of this were the Mayans, who even made a calendar using the stars and space as well as studied astronomy.
