

David Binns
Culmination Project

Report 2:

I was testing out different editing softwares to see which one would be best for my project. I first wanted to try Avid Media Composer because I'm currently taking a class for it, but decided to use Adobe Premiere Pro for the edits. In the clip, not only is there white noise, there are also some missing sound effects. For example, when Tom is placing items like plates on top of the cheese, there is no sound. There is a website where you can search for different types of sounds and images called Pixabay.com. On the website, I found different sounds for plates. There was a sound for plate stacking and plates falling to the ground making shattering sounds when they broke. In the audio track mixer: sequence 01, it has 3 sections of faders where you can lower or heighten the audio. One of them is for removing white noise.
