        My name is Emmanuel Koko and I am a senior at CUNY New York City College of Technology. In my experience with groups, I have found that communication and sense of urgency are very significant. The two work in synergy to maximize efficiency and take the excess workload off team members. In regards to what I can bring to this group, it would be the statistical/research aspect. In the majority of the classes I have taken in highschool up until now, I was required to support my ideas and statements with research from many scholarly sources.

        My name is Anthony Mota and I am a senior at New York City College of Technology. My experience with working in groups in City Tech has molded me to become a leader. The key to a strong group is communication, reliability, and being a team player. The skills I would bring to this group would be being an organizer and having a creative mindset. The project would be divided into parts and each member would be assigned that part they feel most relatable or comfortable writing about.

        My name is Daisy Magdaleno and I am a senior at New York City of Technology as well. My experience in working with groups is a pleasure as I like to communicate with team members to make sure all requirements for a project are done efficiently. I've completed group projects with fellow classmates from previous classes and outside of college. For example I collaborated with my marketing team at an Architectural and Engineer firm for social media projects. I was also part of a team representing Himmel + Meringoff at a Commercial Real Estate internship. During my experience of working in group projects outside of a classroom I developed the need to complete projects in a timely manner before the deadline. It enhanced my work ethic to not only make sure group projects are well put together, but to also respect everyone's opinions. What I find significant in a group project is accountability. The skills I have are extensive research, Adobe photoshop, and social media.
