

Reflection

By Rownak Choudhury

Of the five images produced for the project, four were taken through an iPad while one was taken from a still of the video produced for the project. All of the pictures were then edited with the help of a software called Gimp.

Because the number of pictures needed for the project was not too many, many similar components were not necessary in trying to tie them together. One component which exists in all images, however, is the use of a hashtag in an attempt to tie the images to the twitter rant associated with the project.

The process that I went through in producing the images included coming up with ideas of what sorts of images to create. It helped that I was able to use stock images from various websites to edit and get a sense of what needs to be done and was possible at the beginning of the process. Then I captured my own photos. After capturing and editing my photos, I uploaded them to a Flickr account created specifically for the class ENG2720, Writing with New Media.

The Google Document kept for the purposes of the project helped in giving me ideas of the routes that my project partners were taking. It was easy to gain access to the video as soon as it was uploaded onto YouTube and capture a still from it. Through Google Docs I was also able to keep track and record of my own thought process in creating the images.
