Elements of Design in Fashion Show Critique

### MISSONI spring collection 2021

Recently the famous designer brand “Missoni” showed their latest collection for spring 21 through lookbook/runway. The collection shows that the trend for Missoni spring 21 will have different texture, color, shape, size, balance and harmony. Unlike any other year Missoni used less colors and more mix and match for its collection spring 21.

Missoni is known for their contrast designs. For spring 21 the brand added minimal contrast for their collections. “Silhouettes have been redefined through the lens of comfort”- comfortable matters when people want to wear something less compressed and complicated. The silhouette they used for the collection is very light and thin which brings leave spaces to breathe for the buyers. Soothing and soft fabrics knitwears have been used for the outfits.

The balance of color, images, shapes, patterns are eye catcher materials for the customers Missoni has been using colors and their famous “Zigzag” pattern in their every collection. For spring21, They have used narrow zigzag patterns in their bikini sets, mini skirts and top sets.

They used varieties of colors but the colors are low temperature, tint and vibrance. It has balanced the new aesthetic monochromatic trend. They didn't use much bright colors for their dresses, skirts and shirts. The symmetrical designs of each outfit are nicely done. The similarities on the dresses are slit. Each outfit has a different style of slits. Some short and some are long based on the length of designs. Each outfit has T-strap stilettos with a zigzag pattern. It's breathable but I like that there's a sleeve and that the color palette isn't spring season type.

The emphasis part of the designs of this spring 21 was varieties of neck design. They didn't keep the neck part similar but came up with different types of designs. Neck shapes are very comfy and have more of a V-shape on it. The design has a minimalist impression. In the pictures They have worked with skinny body-typed models.
