### MULTIVERSE REAL OR FICTION DISCOVERIES?

Scientists want to be right because if the multiverse theory was real it can explain the whole universe and why it is the way it is. I thought many already would have given up with this theory because years after years nothing was found. But scientists had made it clear that they won't be given up that easy until it comes out to be either true or just an imagination. Until they see who is right and by how much?

Scientists have tried to figure out the million-dollar question: is the multiverse a fantasy or a reality. I of course don't know the answer to that. What I do know, is scientists won't stop researching this theory. Why you may ask? Well, I will tell you. Sarah Scoles says "The multiverse actually explains why we're here. And our existence, therefore, helps explain why the multiverse is plausible." Sarah Scoles tells us it's a way for everyone to better grasp the existence of why this whole thing is possible: a galaxy with planets, humans, black holes etc. It's another way for us to better explain life itself without having to wonder or keep imagining stuff.

They even thought of a tool that might prove the multiverse to be true but hasn't still been invented yet.

### WHAT IS THE MULTIVERSE?

To start of the multiverse has a variety of definitions but to narrow it down, the multiverse is an entire ensemble of innumerable regions of disconnected space-time. In other words a meta-universe a theory of a set of multiple possible universes which make up reality. Sometimes called parallel universes.

### SCIENTIST SAY

An important scientist was Stephen Hawking he strongly believed in the multiverse. He said the idea of the multiverse, being an abundance of universes exist at the same time but are far away from one another. Talking about eternal inflation how our universe emerged, space-time expanded at a fast rate. All of these were used to prove that the theory might be true, but with exceptions on how the multiverse might be "if" this was something that existed

#### Movies/ Series of the multiverse:

- Mr. Nobody
- Dr. Strange
- Spider man into the spider verse/ Spider-Man Far from home
- The Flash
- Vivarium
- Coherence

Scientists are still looking for ways this can be true like Stephen Hawking who wrote his last journal on the multiverse. Another important scientist is Neil deGrasse Tyson also believing in the theory and talking about it but with a few remodeling ideas to it.

We might not be the only one with this theory if it comes out to be scientifically proven; we will prove we aren't unique as we think we are and we are just a small detail out of a giant picture.

Another thing is we might be living in patches patches existing around the universe that we are not aware of just yet.

Neil DeGrasse said "there would be no way to synchronize it compared to our time one patches will be born at different times so the time they would have transpired since the creation of our patch to reach the point where
