

Joab Liriano Jr

So, last week we were able to visit the NY Daily News building and from what I remember I believe it to be the first time I visited such a large design work place. If I think about it the one floor where everyone was working was huge and so many television screens, giving the news was fun to see. I got to learn a lot about life after school and I learn that it's those small details that are really important in having a healthy career.

So listening to answers, I learned about the phrase UI and how it's the look and feel of a specific design presentation. While UX is more of the optimizing the product for effectiveness. My knowledge of these two specific terms may not be perfect but it is now something I know that I will have to learn more about before I start my own career outside of school.

What was more on the surprising side was the fact that the adobe suits are not always the best choices out there. A program called sketch was said to be more reliable and easier to use in general compared to photoshop. Sketch is also better for designing apps and programs like Asher or Envision are best for prototyping these apps. This enhances the idea that as long as the work is done well and in time, most of the time it wont matter where it's done.

Being known, showing you really do care if people remember you, and showing your kindness are very important in trying to land a job. Why ? Well it gives more reason to why you should get picked, it creates an assurance that if picked, you will be a kind

and dependable person on the job. This idea puts you on better odds against the rest because it shows that'll you'll go that extra mile when needed and be humble when doing it.

Lastly, you have to be open to learning more, because with this you will become a staple at any job and be able to grow with the company. Always open your mind and you'll learn at any job.
