Prof. Pitts-Raina

Sex could be described in terms of being a sexual activity or a gender. Sex can be seen as being essential to the human life, reproduction can be executed minus sexual activity with the assistance of in vitro fertilization. Sex is performed to ensure the process of reproduction not only between humans but animals as well. The documentary discusses sexual selection which refers to a process between females and males strive to elevate the possibilities of successfully reproducing an idea put forward by Darwin.

Throughout the film various animals are displayed such as the peacock used to represent the ways to mating, the male peacock utilizes his bright colored tail to attract the female by rushing over performing a little dance shaking or rattling his feathers, this gesture can make him become spotted by predators in an effortless way in my opinion this shows that the male peacock gains a higher chance of reproducing due to these characteristics. Darwin believed a species wouldn't be able to survive without mating causing genes to die leaving no off springs relating today's time where one can be judged for choosing not to have children. The film explains how men look at each other as competition which can be a masculine trait while women see men as choice being able to pick a mate out of millions of options referring to the peacocks since the male uses his feathers to attract the female leaving the female to determine if the male is strong enough to mate by the size of his tail, similar to humans where a man will try his best to make himself stand out from the others to catch the attention of the woman or women he's after convincing her that he is

the one for her while the woman picks the right suitor with the best genes. The documentary touches on gender roles being reversed discussing how the female Chicano lays her eggs for the male to keep them warm and raise the chicks leaving freedom for the female to produce more eggs which isn't the traditional method for a female to have male characteristics. Since it is well known for males to stay back to nurture the eggs other female Chicanos prey on the eggs by destroying the nests mating with the male in order for him to protect the nest now showing how the animal competes to mate. Similar to human chimpanzees' males are extremely dominate when getting the females attention to perform mating, on occasion chimpanzees practice homosexuality weather its between two men or women to fulfill their urge for sexual activity. Overall, the documentary expresses how animals participate in sexual selection when choosing a mate to reproduce based on factors such as dominance, visual/physical features or benefits similar to humans displaying there is not difference between the two. In my opinion there is a big similarity between humans and the songbirds with the shift of attractiveness towards genes, but the strongest similarity has to evolve the peacock due to human males trying there best to impress the female with the use of material items or physical attributes. After watching the film, I believe people along with animals are placed on earth to continue the process of reproduction as well as the theory of evolution.
