Ancient Egypt- National Geographic it introduce ancient Egypt. It talks about their beliefs and there way of living. Egyptians believed in the afterlife. When a pharaoh or a powerful person died they would wrap them up and place them in tomb. Egypt was ruled by pharaohs and was one of the greatest civilization in the ancient world. They created the first national government and the forms of athematic. Without modern technology they created three big pyramids for the three great pharaohs, pilling 6 million lime stones and granite rocks. It took them about 80 years to complete this project. Egyptian people tried to achieve their own way of immortality. This led them to create pyramids by having the belief that they could reach immortality.

The video itself was enjoyable. It gives clear information and was a short quick summary of how Egyptians lived and what their believes were. It describes how their belief lead them to create amazing things like pyramids and the first national government. I believe that it is an effective way of learning about other civilization through videos because not all people could travel. It's much easier and faster to access to. I also think that the best method of learning is through going to a museum. You get more out of it. If you don't understand you could see it in person and visualize the things they had created. You can actually get the idea of what their culture was and could ask questions if you have any.

The Egyptian civilization challenges my concept of architecture as a fascinating and amazing creations. Architecture can be challenging but with work with others things can change. I find it amazing how people made a pyramid with blocks that can weight more than 40 tons. Architecture is a hard work but can still be accomplished with a good purpose and function. I believe that architecture can be made with belief and imagination as well with a good purpose and function.

Architecture is everywhere. Architecture for me means shelter or a living space for anyone. In architecture there are different type of style. There are so many ways of design a building or skyscraper. It involves various things like art and knowledge. The reason why I want to be an architect is because it's a career where you can create a building or any structure and bring them to the real world. Also because you can show the hard work and be proud of yourself and be able to see how much you have achieved. The other reason why I also want to become an architect is because you have to use your imagination and be able to develop new ideas. You get to create something that comes out of you. I want to have the feeling where you go outside and be like wow that's my skyscraper, and just feel good about it. I believe that architecture is nothing compare to another job. I go through other careers and its nothing compare to architecture, its lots of things to memorize. For example like the medical field you learn a lot as well but they aren't able to create or express their ideas on their work. There are a few careers where design occurs but I feel that architecture is more important. It has to a lot with people's safety and protection. I want to create buildings and make a change in the city. It does has to do a lot with imagination and thinking but by using your imagination it can lead you to other ideas and help you come up with a better concept. It also begins to make me see things differently than others. It's like I enter my own world and begin to see news things and start coming up with ideas. I feel like making a great change and help others.
