

Renewable
Energy &
Sustainability

What is considered Renewable Energy?

Now you may be wondering what is renewable energy well its simple

Its really anything that can be transformed into energy, and can immediately be reused again and again, not like coal that is burned and then well after that it no longer useful.

Examples are; water, wind, and solar

How does sustainability come into play?

Well as you see I saw renewable energy and sustainably, something that can be reused repeatedly, brings substantially to us for example the economy, and our sources or energy. For example fossil fuel, we know we are running out, its not going to be here for ever, we cant always relay on it, rather if we do relay something that we know that is always going to be there, for example our sun, air, water. We don't have to. Not just keeping our earth clean but were bringing a sustainable life form to our planet and humanity.

Are people aware clean energy can help crate a good economy.

We can crate up to metric tons of electricity a year with clean energy, saving us so much from pollution.

Time to save the world!!!

We need more clean air people can die.

EHH IDC we need money a few lives don't matter.

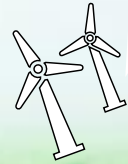

Can you humans not see that you need me to survive?

I wonder what would a world be with wind, hydro, and solar energy be like?

We want a healthy planet for our children.

You guys know I can save hundreds of lives.

Some important topics

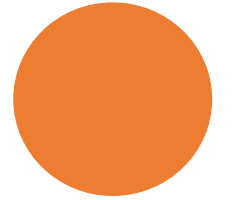

How Costa Rica can give Amazing results!

Did you know even know a small country such as Costa Rica through out the years have slowly taken out their funds from there military, that they don't even have one, and use that money for the public, as well for the environment around them. To help protect the wild and forest life.

“In the '50s, we started investing in hydropower, and that kept us away from the trap of using fossil fuels for electricity generation, which is what the world is struggling with today.”

In this little quote I have shared form a TED talk from a women called Araya, Monica on how Costa Rica over the years have made tremendous progress to amplify that renewable energy is good, and that we need it now.

What is LEED?

Have you heard about LEED it stands for Leadership in Energy and Environmental Design, many facilities and buildings have this across the country, for being sustainable and energy efficient. There are so many ways people, can help take sustainability as an example being rewarded for a design that is efficient to our environment not using so much resources to run or maintain.

Hydropower in small places

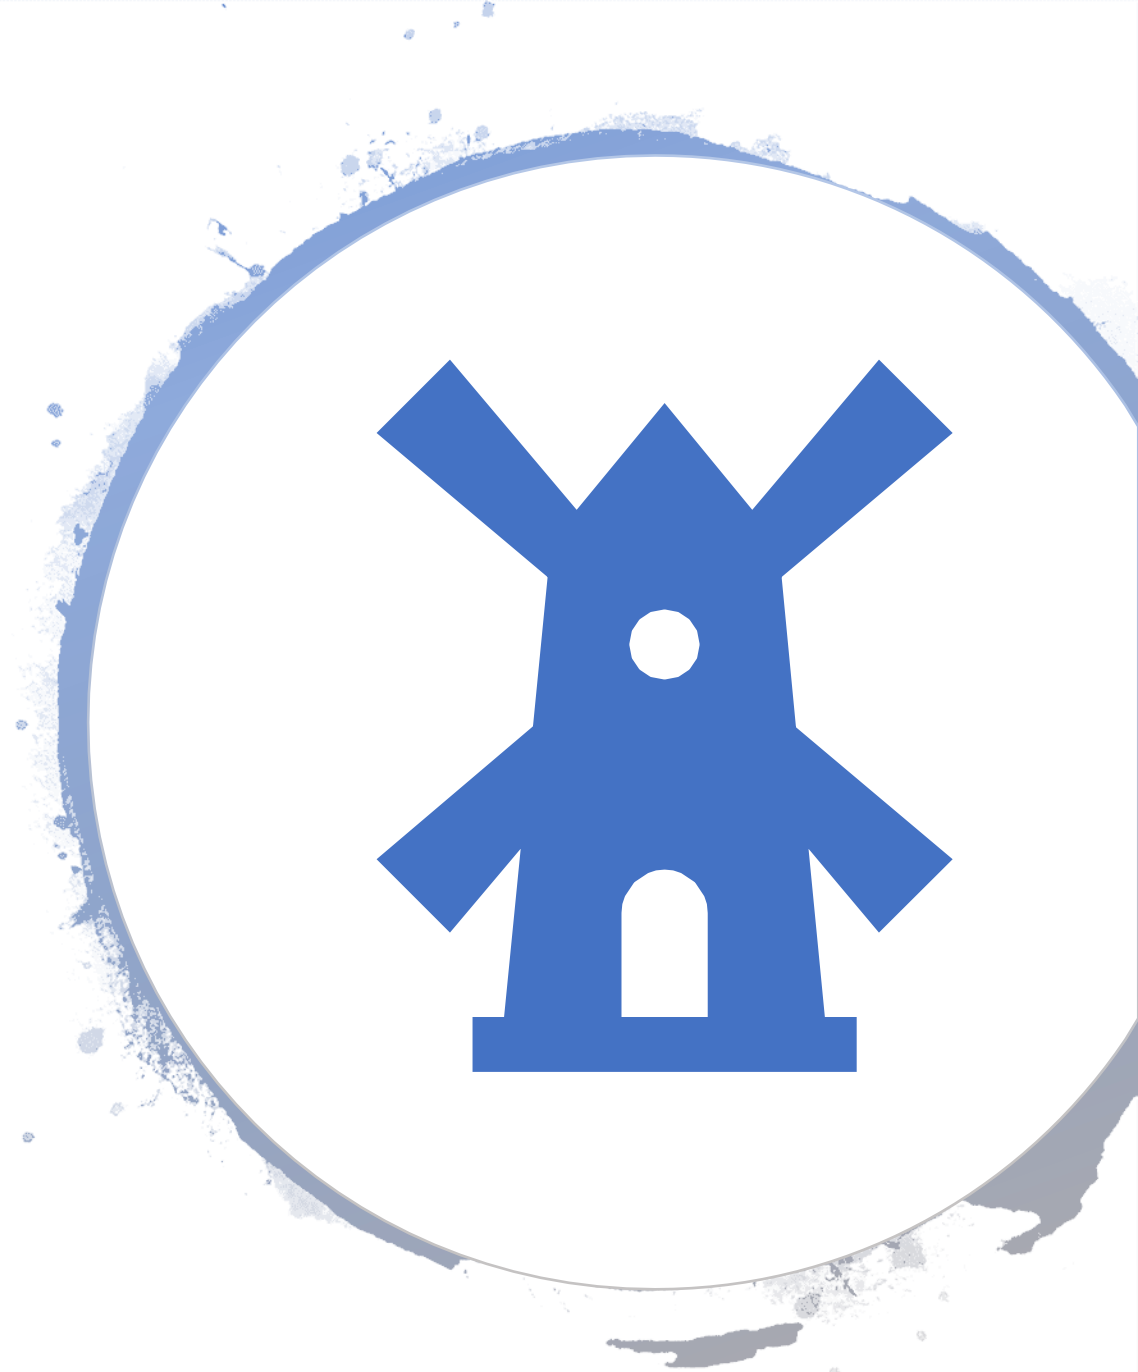

Have you heard renewable energy can create up to million of jobs, creating jobs from hydropower plants in small towns that can benefit many that don't have a job, and the best part is your helping the people and environment around you

In a article from BBC news it says.

"The operations and maintenance base in Eyemouth has been estimated to provide up to 50 jobs over the 25-year lifespan of the development."

This just shows how a small town, one place can provide so many job opportunities.

Now just imagine if we could place these all over the world in other small towns. It can create millions of jobs for maintaining the place.

How bad is it?

- Throughout the years did you know us as humans have increased the CO₂ concentration by 47% since the Industrial Revolution. Which in case you don't see that as bad. Lets just put it in other words, we have increased CO₂ concentration, since the Industrial Revolution, much more then this planet has exited

Conclusion

Build a Better Tomorrow
Improving one life at a time

To conclude this slide show I have put together, I would like to say that climate change and the nonuse of renewable energy is serious topic in todays world and becoming more of a big issue every single day. Many important people, can influence the outcomes of many things. However it only takes one dream, great determination and effort to get to that dream.
