

ARDUINO 4-DIGIT DOOR LOCK SYSTEM WITH NOTIFICATION

Hameed Akinwunmi, Julio Dominguez, Frederick Tetteh, Aparicio Carranza

19th Annual City Tech
Poster Session

Department of Computer Engineering Technology

ABSTRACT

We live in a society that is rapidly advancing towards a future where technology and comfort is paramount to our everyday living. We have designed, developed and implemented and affordable door lock system that will be accessible via a four-digit programmable code. We use a 3D printer(Yemi), Solid Works and Arduino microcontroller to realize our door lock solution. Our system uses a video camera to record and send an email notification whenever a movement is detected by a proximity sensor.

INTRODUCTION

- We are making a Programmable 4-Digit combination lock with Arduino
- With the use of 3D printer we will make a house for the number pad that'll be used as the input device.
- In addition when the door is successfully unlocked a notification will be sent to the owner.
- A proximity sensor will be used to detect any movement in the case of forced entry and send a notification to the owner.

CODE

```

• #include <Keypad.h>
• #include <EEPROM.h>
• #include
  <LiquidCrystal_I2C.h>
• #define Solenoid 11
• #define O_Button 10
• #define I2C_ADDR 0x27

```

EQUIPMENT

- Arduino
- Arduino IDE
- Ender 3 3D Printer
- LCD Display
- Keypad
- Proximity Sensor
- Power Supply
- Servo Motor for Lock

EQUIPMENT DESCRIPTION

- 3D Printer - 3D printing uses computer-aided design(CAD) to create three-dimensional objects through a layering method
- Arduino - Open-source electronic prototyping platform enabling users to create interactive electronic objects
- Solidworks - A solid modeling computer-aided design (CAD) and computer-aided engineering (CAE) computer program.

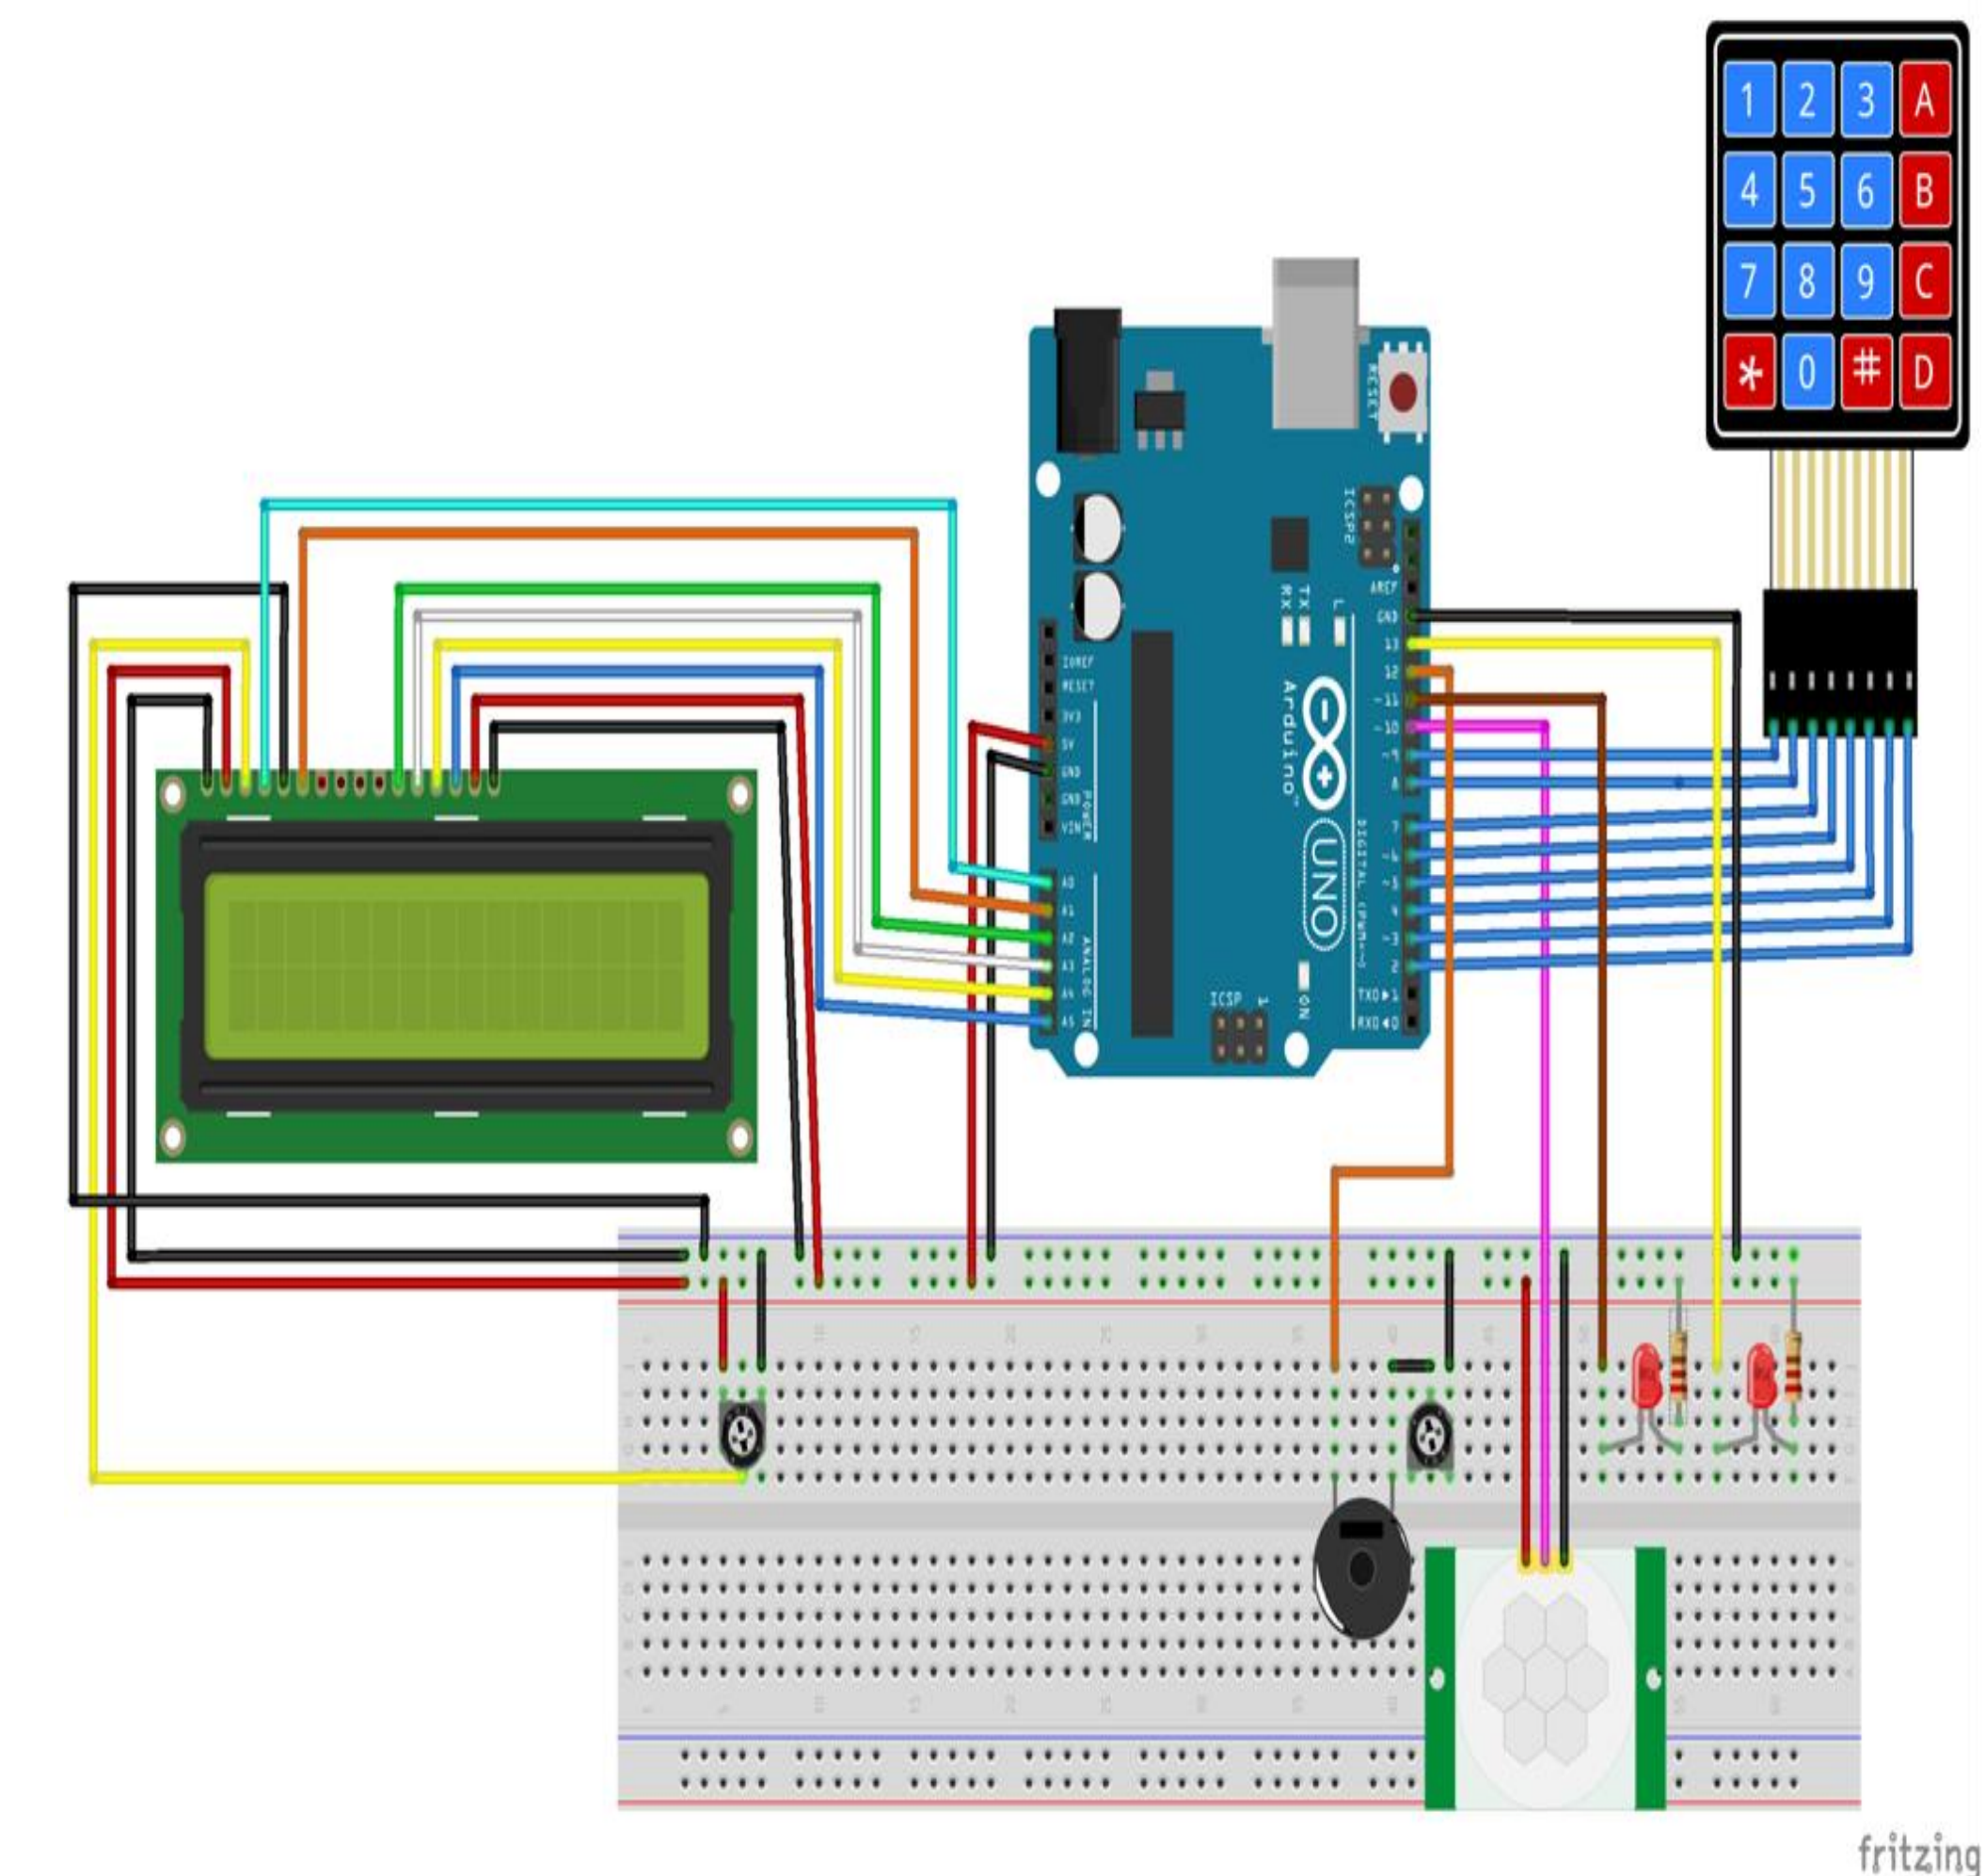

EQUIPMENT 2

Ender 3D Printer

SCHEMATIC

CONCLUSION

- Designing a lock system using SolidWorks.
- Refactor code to include an alert system whenever an attempt to open the lock is made.
- 3D print the components needed to build the lock system.
