Culmination Project

<u>Culmination Proposal</u>

In my last semester at Citytech, I will be working on and presenting my senior culmination project displaying some of the skills and theory I've learned over the last two years in the Entertainment technology department. For my project, I've decided to create a series of lighting cues for an entire album of 7 songs using GrandMA 3D. Each song would have its own set of lighting cues, mimicking a setlist/cuelist for a live show. This is a project I completed in the lighting controls class last year, but it was for only one song and it would be on the 3D software. This would allow for me to further my exploration of the grandma console, something I have a little experience in but would like to expand on. In addition to all of the actual lighting cues, I would provide a light plot and channel list as deliverables.

Creating these lighting cues would allow for me to build on my moderate experience of the lighting software, as well as continue my studies in lighting/scene design and how important the artistic aesthetics of lighting are as important as the technical exercise of programming and cue creation.
