## Introduction

What could have been done to prevent the risk of Covid getting worse? I got interested in this question because since Covid has begun and has affected the United States i wanted to know what we could've done as a country to prevent the bad spread around all these states. When Covid was coming around the United States didn't really react to it quickly. Businesses, schools were still opened and that was another thing that was making things bad. Not everyone really cared about it at the beginning until they started to notice that it was taking lots of people's lives , especially elderlies. That when it was being posted on the news that this virus was killing lots and lots of people.I know that Covid comes from animals in a country in china. I want to know that since this pandemic has started has anyone, doctors, spectilist and others, gone together to try to find a vaccine that can cure people all around the world and in the United States. I also wanted to know how long or what the doctors are doing to find a vaccine to cure the virus. I want to find out how long it would take the doctors or specialists to find a vaccination and or what they are doing to help people that are sick. If I don't find information that fits what I am looking for I would continue to research about Covid-19 and find out how the world is reacting to the things that are making the world in more danger and what we can do to prevent that. I would also speak on how the current president is reacting to this pandemic and I want to know if he really cares about it and the lives that are being taken away from this. And what can the president do to help come up with a vaccination to prevent the spreading even more.

In this article the author explains what they are trying to do to create a vaccine for the virus. It takes about 16 weeks to identify the virus in your respiratory system. While doctors are coming up with vaccinations that may take up to 12 to 18 months they are testing it on people from all around the world. They have gone to go to Africa to test the virus on kids and parents. But they have not physically tried it on patients who have tested positive for the virus because they feel like the vacieen isn't good enough to cure the virus. They have been speaking to others all around the world to see if anyone one can help find any vaccinations that can cure the virus. And the

viral vectored vaccine they've been trying to use to see if it can fight the cells. Doctors have been very frustrated with trying to find a cure to help the world but sometimes it takes time to find something as the world gets into a more environmental force they are trying to get everything set before things get worse. Doctors are trying to get less frustrated with this situation and make life better. Since the virus has occurred they all tried to react as quickly as possible but everything was getting worse and they couldn't react quickly. Once they found out the virus was getting worse they had to close the borders for everything because they didn't want the United States to get any bad. They have made vaccines to help boost people's immune systems because Covid takes down Your immune system which you need to live. They have some injections that they put into people's bodies to mimic the virus to see if the body would fight it off. Doctors from the United States have got in touch with the Uk vaccine magnification center to see if they can help them.

“He admits he has been frustrated by opportunities not being taken to improve operations, though notes that regulators are showing more flexibility with operating companies.”

“Advanced planning and preparedness is critically important to ensure a manufacturer is in a position to respond to an outbreak. That is part of what VMIC is there to do.”

In this article the authors explain the way they are trying to come up with a vaccine. In the university of Queensland the doctors are coming up with ways to put in work to make a vaccine. The CEPI (Coalition for Epidemic Preparedness Innovation) have said that within the six months range that a vaccine would be out to be tested on patients. They are working on finding a way to keep the virus good because knowing the virus was air contagious and can be passed through humans easily scientists are trying to find a cure that can keep things safe between humans. People with first responding to corona would be using the vaccine to test and see if the vaccine would keep them safe from the virus. The virus is something that affects your immune system

really bad. And the cure they are trying to make is to do something that helps with people's immune systems.

In the article there were important parts in the text that stood out to me. I feel like when they were talking about humans' immune systems and how they are trying to find a vaccine to help with that was important to me. I feel like if the doctors find a cure for the immune system it would help a lot with the whole world because people's systems aren't strong enough to fight the Coronavirus and having a vaccine to help people out will be very helpful and would save people's lives. People with weak immune systems like elderly, and or people with disabilities would love to hear that the scientists have found a good cure for the virus and would help people out with really bad symptoms of the coronavirus.

“The University of Queensland’s molecular clamp technology provides stability to the viral protein that is the primary target for our immune defence”.

“University of Queensland Vice- Chancellor and President Professor Peter Høj AC said the fluidity of the current outbreak represented a significant challenge to the international community. ‘There is a lot that is still unknown regarding how easily the virus is able to be transmitted between humans’”

In this article the author talks about how healthcare workers from every hospital have to have good communications to help one another find good vaccinations for patients and others. People who suffered from Coronavirus couldn't really do anything with how they were but now that so many people died they are trying to prevent that from happening again so they want all healthcare working to be cautious on how they treat their patients with corona. Dr. Jennie and her workers are looking into the latest vaccine to see what they can do with that and try to put that in as another vaccination. They want to look more into details about that vaccine to see if that can help with corona and people who are sick. The practitioners and specialists are the one looking more into the vaccine and have to make sure they stay away from the flu vaccinations. There was a vaccine that was made in 2019 that helped kids that had a conjugate vaccine that against the pneumococcus has dramatically reduced disease in older people. When students return to college campuses, there is protection against meningococcal meningitis also spread by respiratory

droplets is mandatory. They have to get tested with that to make sure their respiratory system is safe. Having 2 different vaccines for traveling and for kids in school is impressive so that the way the kids get sick is different from how others get sick from traveling.

This article gave me a really good feeling that they can find a vaccine as soon as possible. These practitioners and specialists are working very hard to come up with something to keep kids and parents safe from the virus. They don't want to have any more bad deaths like when it first started. Lots of older people have passed due to the fact that not everyone was taking it serious when it first came out killing lots of people. Having a vaccination would really save lots of people's lives because not everyone is strong enough to fight something bad. The Coronavirus messes up ur insides like your immune system and respiration system. So if they are not strong enough to fight off the virus then having a vaccine that takes a couple of seconds to put in your body would save thousands of lives. So I feel like they are getting into the process of finding a vaccine to help the populations out. Kids, teachers and parents would be amazed if a vaccine has come out because they would be about to go back to normal lives. Kids would be able to go back to school, parents could go back to making their money for their family. And teachers would be able to see their kids face to face and no more remotely because kids aren't learning well that way. So finding something like that would be great for the world.

“Vaccine hesitancy clouds the mission of protection of the entire population. Educating, supporting and hopefully vaccinated individuals who may harbor selfish or unfounded fears may protect our vulnerable immunosuppressed individuals.”

“Vaccines help us go to school, help us travel to learn about other places and cultures and appreciate each other and help us see our grandparents. Vaccines help keep us together.”

## Conclusion

After researching Coronavirus and Vaccinations i learned that the United states and other countries all around the world are actually working together to come up with a vaccine that would help people. The vaccinations have to work within the respiratory system. Corona affects people's respiratory systems and finding a vaccination that can fight out that virus in that system is a success. But in the articles I was reading they have said that it takes up to 18 months to find a vaccine to create one because they need to make sure that the vaccine is strong enough to help fight the virus. Specialists and doctors all around the United States are communicating very well to help one another find vaccines to help so places can reopen and have the United States back to normal. What surprised me about this was that it doctors not only in the U.S but doctors all around the world is trying to find a great vaccination that can cure people.that made this very exciting because it is showing us that people actually care about others healths and wat to prevent the virus to spread even more all around again. Doctors don't want to go through this

insane process again with lots and lots of people stuck in a hospital all sick and dying. So them finding a cure shows that they actually want to live a normal life and want to just help others that are in need. I would not change my topic about Covid-19 and vaccines because reading so many articles about it gave me a lot of information on what they are doing all around the world to keep others safe and to prevent the spread again. I want to look more into how and what the current president is doing to help out with finding a vaccine to cure everyone including him. What I learned is important because not everyone would want to sit here researching Covid and what people are doing to find a cure, some researching about this and gathering good information that can help and teach others to tell them what is happening and what we can do as people to prevent the spread to get worse. I would like to teach others and let them know what doctors are doing to find a vaccine to cure the respiratory system. I think children, adults and even the president should know about this because this topic gives out very good information about what people are trying to do to prevent the bad things from happening again and what part of the body the virus affects. Because if you do not have a strong respiratory system then people should be cautious on what they do and how they do things.
