Coronavirus and Vaccination

December 1, 2020

**T**he most important part I learned in unit 2

was that people all around the world have not taken corona very seriously. Lots of people have died due to the fact that they weren't listening to the news and being cautious of it. The world is trying to come up with a vaccination which can help cure people who are in need of it. They need a vaccination where it would help fight the corona in the respiratory system.

“The

University of Queensland’s molecular clamp technology provides stability to the viral protein that is the primary target for our immune defence.” Developing a coronavirus vaccine. Chemistry in Australia, [s. l.], p. 6, 2020. Disponible em. Throughout my whole research I have found 3 amazing information that has taught me and given me some good information which I can write about and help others all around the world to take this virus very seriously. These sources helped me and gave me details about what they are trying to do to find a cure for the coronavirus. And what the doctors are doing to work hard and find a vaccination to cure the virus as soon as possible before it gets worse. There has been a big change all around the world because of the virus. People have lost someone in their lives because of this. If a vaccination is found it would make the world better. Everything would go back to normal where parents are back working their normal shift and kids are

“Vaccines help us go to school, help us travel to learn about other places and cultures and appreciate each other and help us see our grandparents. Vaccines help keep us together.” MILENO, M. D.; JOHNSON, J. E. A Review of Current Vaccine Recommendations. Schedules for Children, Adults. Rhode Island Medical Journal, [s. l.], v. 103, n. 6, p. 28, 2020. Disponible em. Adults and children would be very happy if the vaccination they come out with actually works because it would make everything go back to normal. Kids aren't learning the way they need to for them to learn and pass all their classes. And adults aren't getting the hours they use to work before the virus has hit the United States very hard. There are doctors all around the world who are trying their best to come up with a vaccine like communicating every day to figure out what type of medicine the need to put in to help out people with weak immune systems. They have agreed that this process is very frustrating. It is a difficult time to focus and try their hardest to come with a vaccine.

“He admits he has been frustrated by opportunities not being taken to improve operations, though notes that regulators are showing more flexibility with operating companies.” Coronavirus: the push to produce a vaccine. TCE: The Chemical Engineer, [s. l.], n. 945, p. 8–9, 2020. Disponible em: this process is very hard for these doctors to proceed a good vaccine that can help everyone out. What I learned is that people need to be more serious and listen to the rules that are being said or there would be another long lockdown because no one is listening. I feel like people should not take this as a joke because more people would begin to die if they don't wear their masks and take care of themselves.
