Report.

The items that caught my eye during the trip is :

1. The machine that can cut through almost 5,000 papers with **exact precision** amazed me. I loved how sharp edged and careful the machine was. There was a red line t guide exactly where you wanted it to be cut and if you feel its not perfect, the machine can take off an extra **centimeter!**
2. The other machine I enjoyed was when the machine that put the paper, without any wrinkles and rips, into the envelope with no problem. The speed of it was amazing since they can go up to 1,000 letters. I also liked the small mistakes it made when it jammed because even when it jammed for a little, the machine slowed down a bit as if it was being careful not to make that mistake with the other ones. Then they came out perfectly folded and stamped on the conveyor belt.
3. The last hands on machine I enjoyed was the one where papers such as Pm where it comes with a white paper on top but pink and yellow wonder as if you were writing on three papers. I loved this machine because the glue was specifically made for these papers. It could tell the difference between the pink and yellow and made sure it didn't bleed through the others. But the glue also knows when to stop after glue exactly the three papers per copy. It amazes me how a glue can be so efficient.
