

Microbionts medicine case study

How microbionts has born a new
cure to flu sickness

Overview

- To cope with the vast toxic landscapes that resulted from industrialization and petro cultural lifestyles, the third and fourth decade of the 21st century witnessed a massive increase in research on microbionts and fungi that could decompose and process toxic petrochemical compounds. At the sametime, microbionts has made an antivirus for human systems. Whenever a person is catches the flu the microbionts can erase it within one day which is surprisingly faster than normal recovery time. Microbionts will change the way we view antibodies for flu.

- “As a few testers who were the volunteers to have microbionts create a better anti-body system that would erase it within 12 hours. it will benefit millions of people throughout the whole state who at least get sick 2 times as much.

What's the approach?

- Our Science technology department will develop the microbionts to test on workers to observe the results for our anti-body system.
- If the test is successful this information will be sent out to health departments from each state to choose one group of people to receive

- Health / Technology companies will spread the creation over the media and all them will start producing the microbionts
- The microbionts will be given to thousands of people to and they will be observed to see what kind of effects the microionts have which will determine if they are approved.
- Once the states health departments approves it then this will become the new antiviral for flu and it will be distributed nationwide..

Results

- 80% People were treated with the microbionts
- 20% had minor side effects
- 70% health departments approved start to add microbionts as medicine to hundreds or thousands

Conclusion

- Microbionts are going to become the new innovation to antibodies for flu. The nation would like to see the health department combine new technologies that can benefit us all through this new technology.
