

Earth like planets

My belief is that we are not alone and that there is extra-terrestrial life forms and that's why my project is based on Earth like planets and if they are able to be hospitable to life. The main Earth like planets is the Kepler Planets. There is Kepler-22b, Kepler-20e, and Kepler-20f. In this project, I explained the different specs of each Kepler. The size of each Kepler compared to earth and the temperature. Basically it gives an overview of each Kepler planet that was mentioned earlier. The process to how they found the Kepler planets are included in the project. I also included the different types of technology used to help find these planets, such as the different telescopes they used and what their use are for. With all that said I give my final conclusion that we already found a number of Earth like planets as in the future as our technology develops, we will be able to find more and more numbers of Earth like planets. Hopefully we will be able to find one that can sustain life
