

#### **Class Overview:**

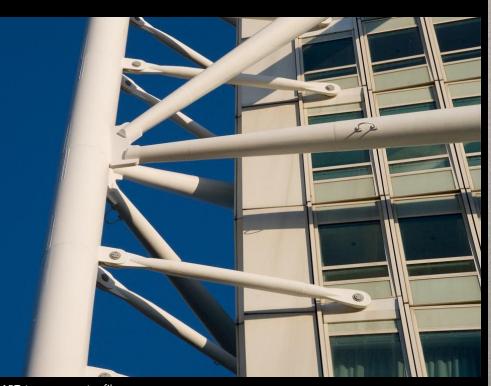

Discussion/Lecture on Geotech + Excavations + Foundations:
 Procedures and Consultants, Geotechnical Investigation, Soil
 Bearing Pressure. Foundation materials: concrete, wood, and steel. Foundation types: deep foundations. Underpinning existing foundations

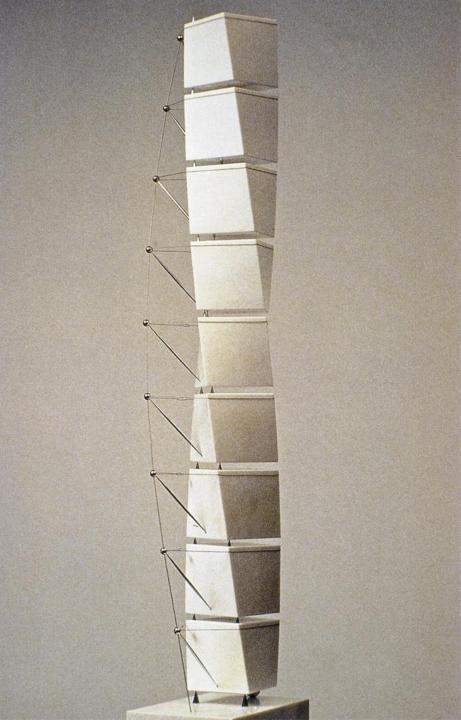

#### **Upcoming:**

Quiz Thursday

#### Santiago Calatrava

HSB Turning Torso

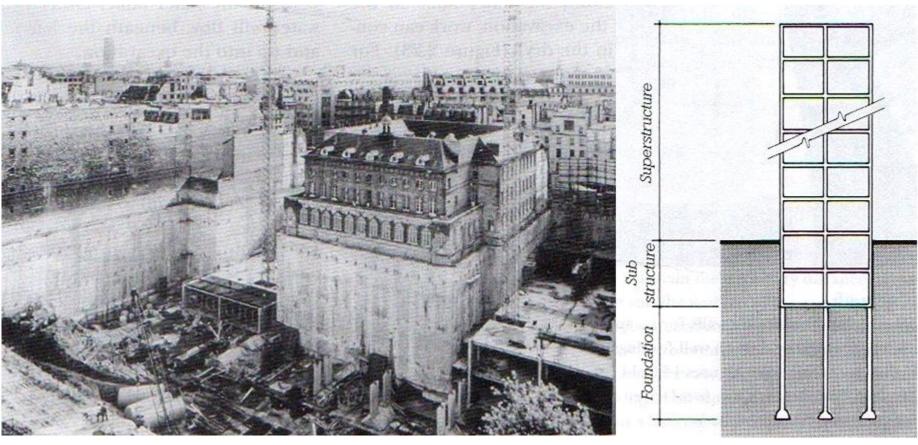

# **Foundation Loading**

Must meet Three Requirements:

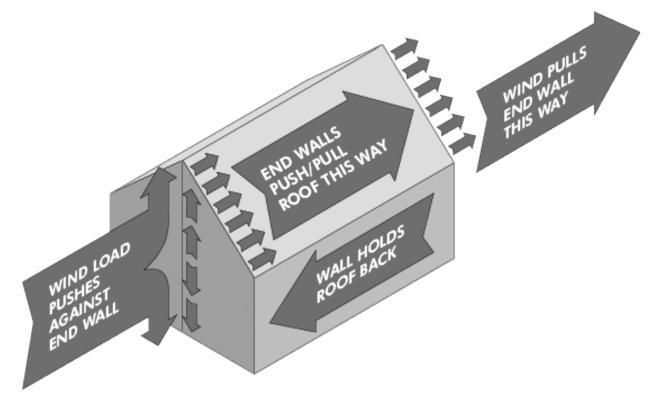

- The foundations, underlying soil, and rock composition must be strong enough to support the structure.
- 2. During the life the building, the foundation must not settle(move) in such a way as to damage the structure or impair its function.
- The foundation must be feasible both technically and economically and practical to build without adverse effects to surrounding property.

## **Foundations**

# Other Loads on a structure:

1. Wind load – lateral, up, down

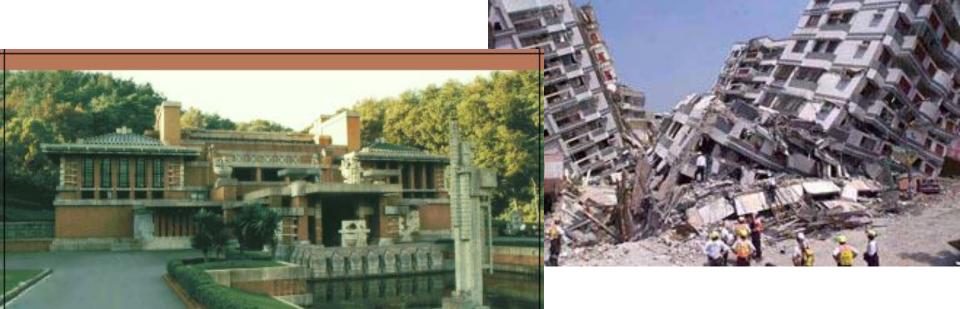

## Other Loads on a structure:

- 2. Earth & water pushing horizontally
- 3. Underground water pushing upward
- 4. Earthquakes: horizontal & vertical forces

# What makes for a good foundation?

- It (and underlying soil ) must be strong enough to support structure above.
- It must not settle enough to damage structure.
- It must be feasible,
   economical to build, & not
   endanger its neighbors.

- 1. <u>Uniform</u>: Equal across foundation
  - = little or no damage
- 2. <u>Differential</u>: Columns & Bearing Walls settle

different amounts

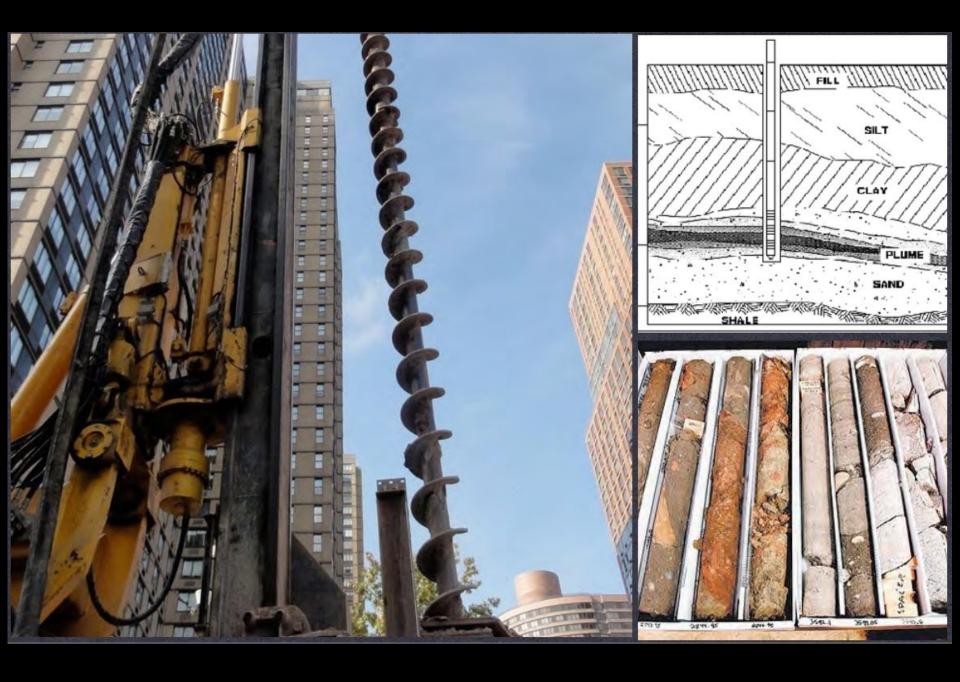

= damage or failure.

Most common cause of differential settlement: multiple soil types under building

# Classifying Earth Materials

- Rock: continuous mass of solid mineral material
  - Generally, the strongest, most stable of earth materials
  - Strength varies with mineral content and physical structure
- Soil: particulate
  - Small enough to be lifted by hand
  - Characteristics and suitability for foundation support vary with particle size and shape, mineral content, and sensitivity to moisture content

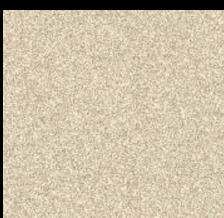

# Types of soil by size:

1. <u>Rock (limestone, granite)</u> Strongest, most stable

2. Gravel (half of particles less than 1 / 4 inch

3. Sand (1 / 4" .002 inch)

4. Silt (.002 – .008 inch)

5. Clay ( less than .008 inch & plate-shaped

# Classifying Earth Materials

#### UNIFIED SOIL CLASSIFICATION AND SYMBOL CHART

#### **COARSE-GRAINED SOILS**

(more than 50% of material is larger than No. 200 sieve size.)

	Clean Gravels (Less than 5% fines)								
GRAVELS  More than 50%   of coarse fraction larger   than No. 4   sieve size		GW	Well-graded gravels, gravel-sand mixtures, little or no fines						
		GP	Poorly-graded gravels, gravel-sand mixtures, little or no fines						
	Gravels with fines (More than 12% fines)								
		GM	Silty gravels, gravel-sand-silt mixtures						
		GC	Clayey gravels, gravel-sand-clay mixtures						
	(	Clean Sands (Less than 5% fines)							
SANDS	9 7 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9	SW	Well-graded sands, gravelly sands, little or no fines						
50% or more of coarse		SP	Poorly graded sands, gravelly sands, little or no fines						
fraction smaller	5	Sands	with fines (More than 12% fines)						
than No. 4 sieve size		SM	Silty sands, sand-silt mixtures						
		SC	Clayey sands, sand-clay mixtures						

#### FINE-GRAINED SOILS

(50% or more of material is smaller than No. 200 sieve size.)

	ML	Inorganic silts and very fine sands, rock flour, silty of clayey fine sands or clayey silts with slight plasticity					
	CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays					
	OL	Organic silts and organic silty clays of low plasticity					
	МН	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts					
	СН	Inorganic clays of high plasticity, fat clays					
er 🎇	ОН	Organic clays of medium to high plasticity, organic silts					
24 24 24 24	PT	Peat and other highly organic soils					
	<u> </u>	CL OL MH CH OH					

#### **Boring Report**

- -- soil type
- -- particle size
- -- bearing capacity
- -- water content
- -- expected settlement

#### TABLE 1804.2 ALLOWABLE FOUNDATION AND LATERAL PRESSURE

	ALLOWABLE	LATERAL	LATERAL SLIDING		
CLASS OF MATERIALS	PRESSURE (psf) <sup>d</sup>	(psf/f below natural grade) <sup>d</sup>	Coefficient of friction*	Resistance (psf) <sup>b</sup>	
Crystalline bedrock	12,000	1,200	0.70	i i	
Sedimentary and foliated rock	4,000	400	0.35		
3. Sandy gravel and/or gravel (GW and GP)	3,000	200	0.35		
<ol> <li>Sand, silty sand, clayey sand, silty gravel and clayey gravel (SW, SP, SM, SC, GM and GC)</li> </ol>	2,000	150	0.25		
<ol> <li>Clay, sandy clay, silty clay, clayey silt, silt and sandy silt (CL, ML, MH and CH)</li> </ol>	1,500°	100	arming and many	130	

For SI: 1 pound per square foot = 0.0479 kPa, 1 pound per square foot per foot = 0.157 kPa/m.

- Coefficient to be multiplied by the dead load.
- b. Lateral sliding resistance value to be multiplied by the contact area, as limited by Section 1804.3.
- c. Where the building official determines that in-place soils with an allowable bearing capacity of less than 1,500 psf are likely to be present at the site, the allowable bearing capacity shall be determined by a soils investigation.
- d. An increase of one-third is permitted when considering load combinations, including wind or earthquake loads, as permitted by Section 1605.3.2.

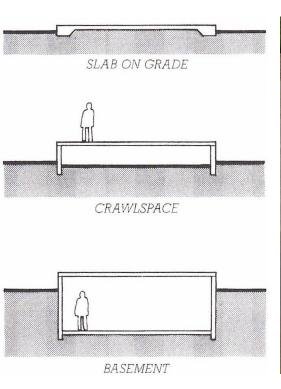

#### ON SITE AND LABORATORY INVESTIGATION CAN DETERMINE:

●THE ALLOWABLE FOUNDATION PRESSURE FOR THE GIVEN EARTH MATERIALS BENEATH THE SITE

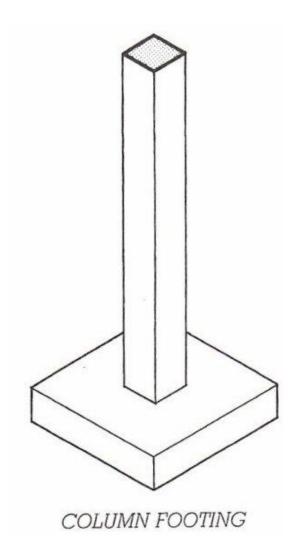

#### **FOUNDATIONS**

#### **Shallow Foundations**

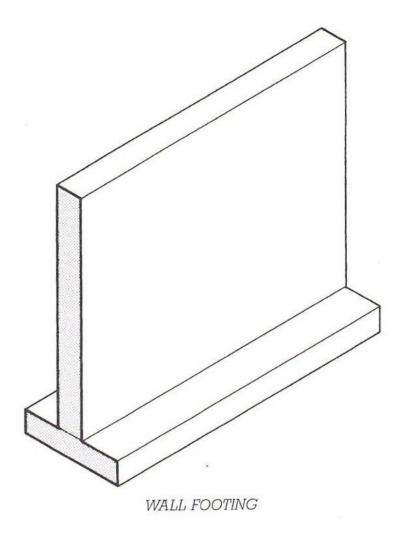

#### **COLUMN FOOTING**

#### **FOUNDATIONS**

# WALL FOOTING (STRIP FOOTING)

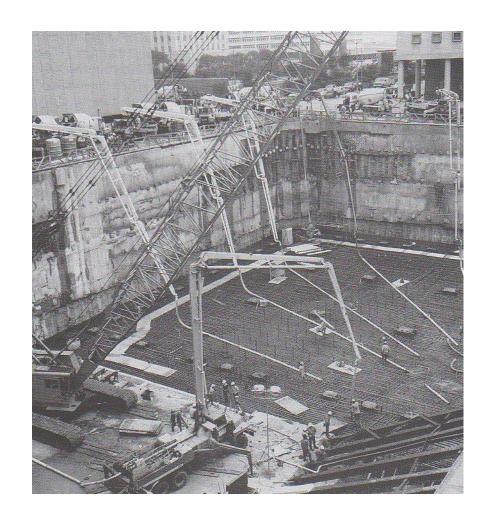

## **Special Foundations**

Shallow Foundations on Soil w/ Low Bearing Capacity

Mat or Raft Foundation

Floating Foundation

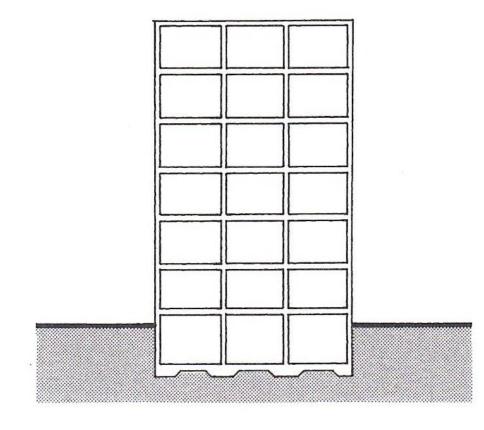

#### **FOUNDATIONS**

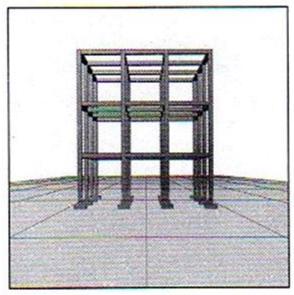

## Floating Foundations

Balances the weight of soil removed with the weight of building to be constructed

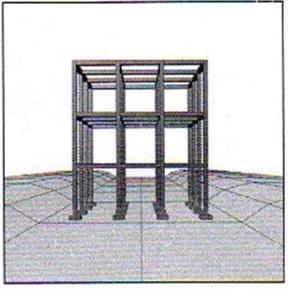

The load on the remaining soil is little changed.

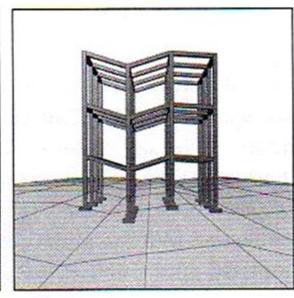

#### **Foundation Settlement**

(a) Building before settlement occurs

(b) Uniform settlement

(c) Differential settlement

"Fundamentals of Building Construction / Materials and Methods" Allen & Wiley

# DEEP FOUNDATIONS ARE REQUIRED WHERE:

1. THE DEPTH OF
ADEQUATE
BEARING MATERIALS IS
TOO GREAT FOR SHALLOW
FOUNDATIONS
(IMPRACTICAL, TOO \$\$\$\$)
AND/OR

2. THE PRIMARY AVAILABLE BEARING MATERIAL REQUIRES FRICTION RESISTANCE WITH THE FOUNDATION SYSTEM

#### **FOUNDATIONS**

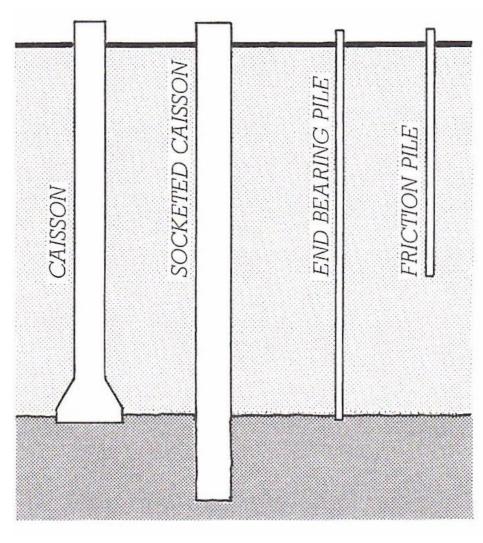

#### **Deep Foundations**

#### **DEEP FOUNDATIONS:**

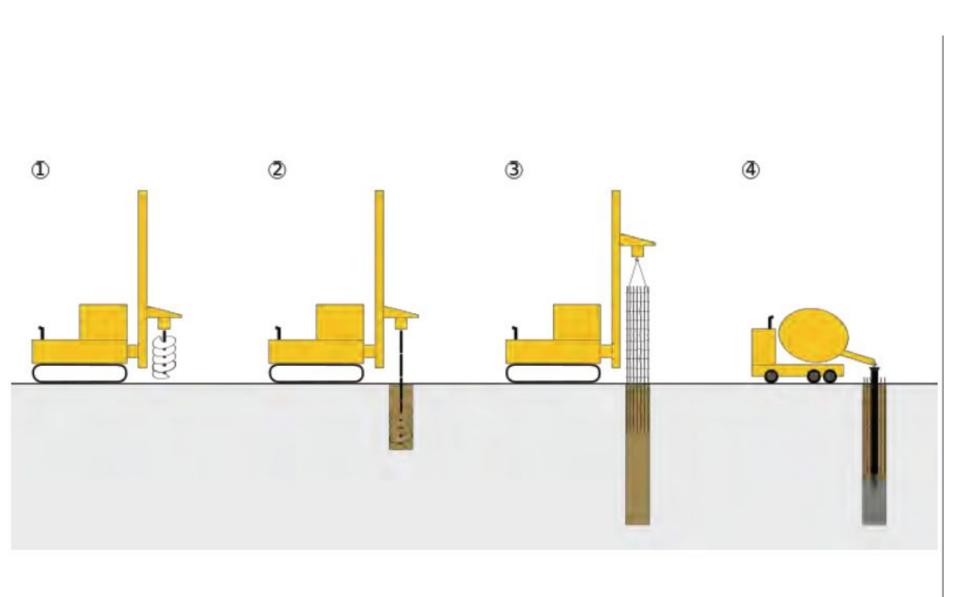

TRANSMIT BUILDING LOADS
TO DEEPER, MORE
COMPETENT SOILS
THE TWO TYPES OF DEEP
FOUNDATIONS ARE:

- 1. END BEARING
- 2. BEARING THROUGH FRICTION

NOTE: SOME DEEP FOUNDATIONS FUNCTION IN BOTH MODES.

"Fundamentals of Building Construction / Materials and Methods" Allen & Wiley

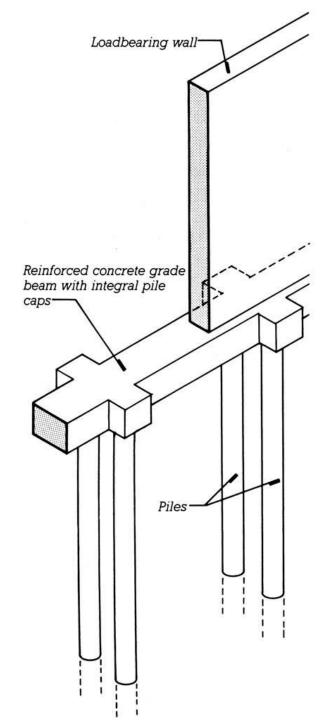

#### **FOUNDATIONS**

#### Piles and Grade Beams

*Pile caps* share loads among clustered piles.

A grade beam spans between the piles to provide continuous support for the wall above.

STEEL CASINGS MAY BE USED TO TEMPORARILY SUPPORT THE SIDE WALLS OF THE HOLE.

REINFORCEMENT IS USUALLY ONLY REQUIRED AT THE TOP TO TIE THE CAISSON TO THE STRUCTURE IT SUPPORTS

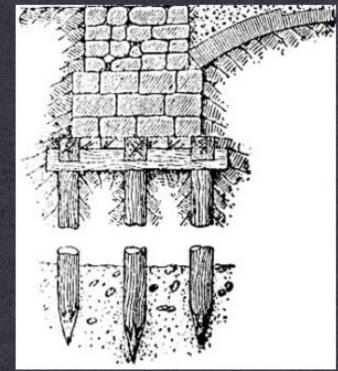

#### PILES:

A STRUCTURAL ELEMENT THAT IS FORCIBLY DRIVEN INTO THE EARTH (AS A NAIL IS DRIVEN INTO WOOD)

#### **PILES:**

#### **MATERIALS USED:**

- 1. WOOD
- 2. STEEL
- 3. PRE CAST CONCRETE (PICTURED)

MATERIAL MUST BE SUITABLE TO SUBSURFACE CONDITIONS

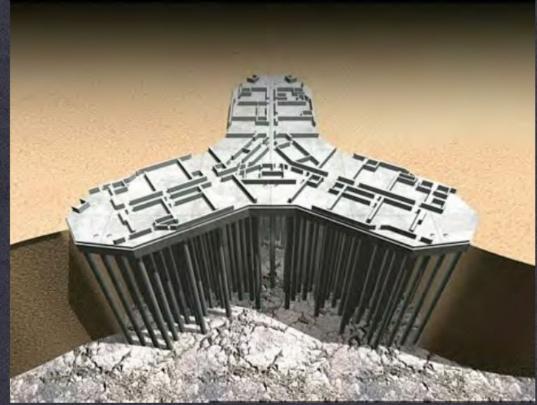

# PILES ARE A COMMON APPROACH TO RAISING HOMES IN FLOOD PRONE AREAS

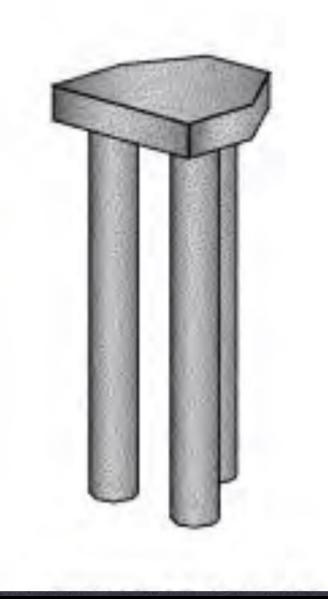

DENSE PILES
CAPPED BY A
MASSIVE MATT
SLAB SUPPORT THE
BURJ KHALIFA

**PILE CAPS:** 

CAPS JOIN SEPARATE PILES AT THE TOP TO TRANSFER AND DISTRIBUTE THE LOAD OF THE STRUCTURE ABOVE DOWN THROUGH THE INDIVIDUAL PILES.

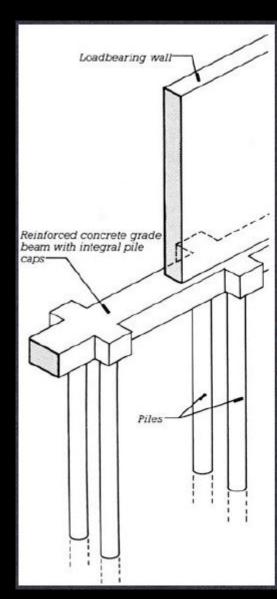

**GRADE BEAMS:** 

GRADE BEAMS ARE SUPPORTED BY CAISSONS OR PILES. EVEN THOUGH THEY ARE FORMED ON THE SOIL, THEY ARE <u>NOT</u> SUPPORTED BY THE SOIL. THE SOIL IS ONLY PART OF THE FORMWORK FOR THE GRADE BEAM

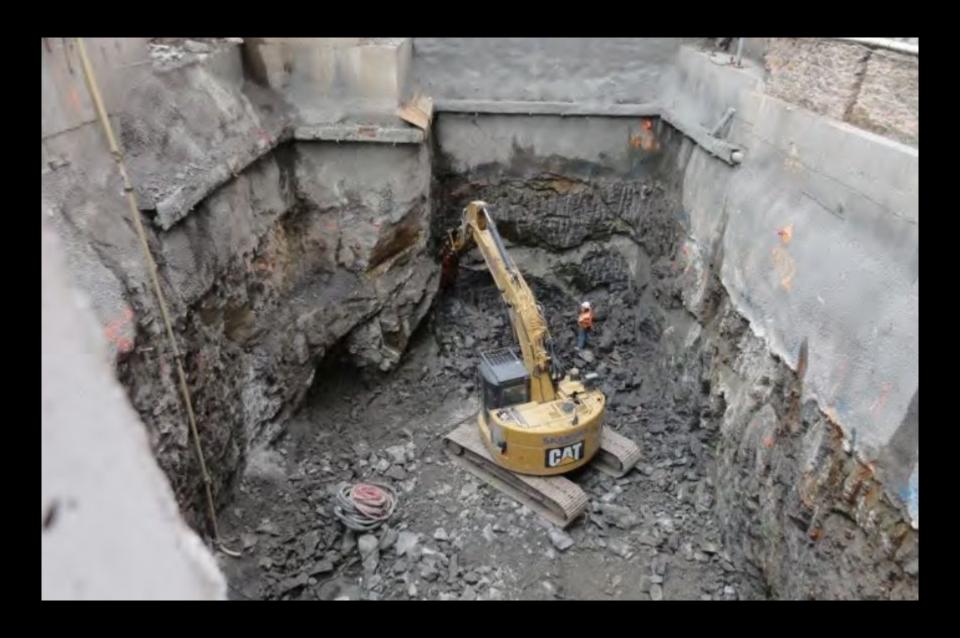

### **GRADE BEAMS:**

REINFORCEMENT OF GRADE BEAMS IS SIMILAR TO ORDINARY CONCRETE BEAMS IN A FRAMED STRUCTURE.

# UNDERPINNING REQUIRED WHEN:

- 1. EXISTING FOUNDATION IS SETTLING IN DANGEROUS MANNER.
- 2. A NEW PROJECT
  REQUIRES
  FOUNDATIONS DEEPER
  THAN EXISTING
  FOUNDATIONS
  IMMEDIATELY
  ADJACENT TO THE
  NEW FOUNDATION

# UNDERPINNING PROCESS:

- 1. DIG NARROW
  TRENCHES WIDELY
  SPACED APART
  UNDER EXISTING
  FOUNDATIONS
- 2. POUR NEW
  CONCRETE WALL/
  FOOTING INTO
  TRENCH
- 3. REPEAT FOR SOIL AREA BETWEEN FIRST TRENCHES

## DESIGN THRESHOLDS TO CONSIDER:

- 1. WATER TABLE DEPTH
- 2. FLOODING HAZARDS
- 3. SITE BOUNDARIES AND NEIGHBORING STRUCTURES
- 4. INCREASED BUILDING LOADS ON FOUNDATIONS (DUE TO HEIGHT)
- 5. LOCATION AND QUALITY OF BEARING MATERIALS UNDER THE SITE

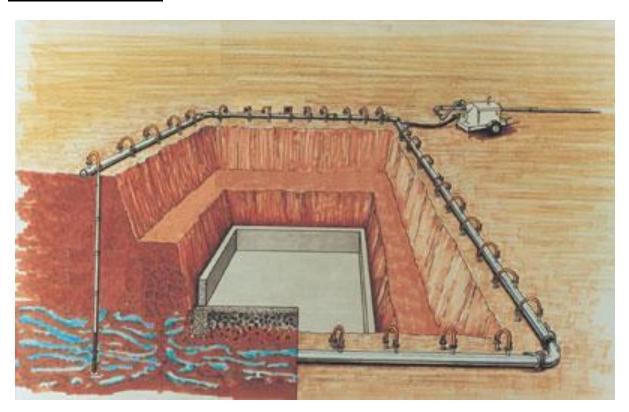

#### **WATERPROOFING AND DRAINAGE**

### **DEWATERING:**

Done when excavating below water table.

Methods: 1. Well Points drain off water

2. Build water-tight barrier...

#### **WATERPROOFING AND DRAINAGE**

## Drainage

Drainage mat and free-draining backfill material allow ground water to flow away from the substructure.

The machine in the foreground is used to compact the fill material as it is placed in *lifts* roughly 6 inches deep at a time.

# Dampproofing & Waterproofing

Dampproofing materials are water-resistant.

Waterproofing materials are resistant to hydrostatic pressure.

## Drainage

Perforated piping conducts water away from the substructure.

Filter fabric "socks" cover the piping to prevent soil particles from accumulating in and eventually clogging the pipes.

# Foundations Summary:

Starts with Subsurface Exploration

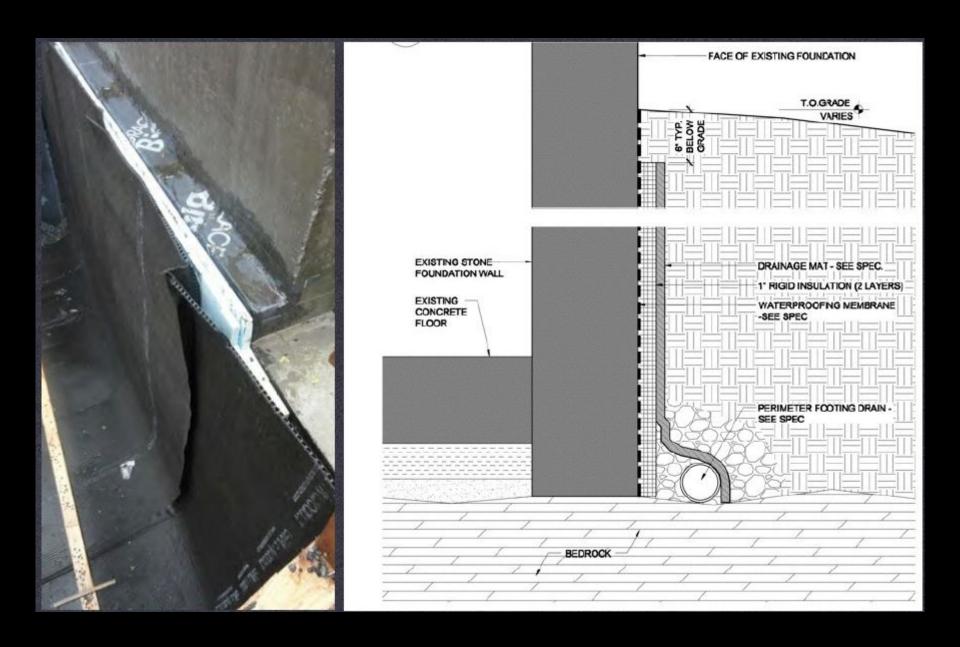

Shallow or Deep

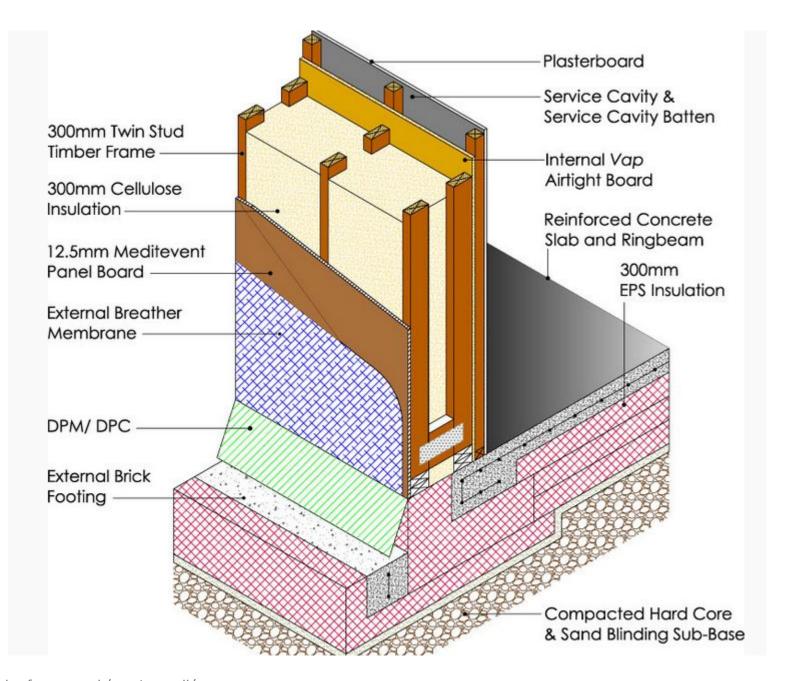

Bearing or Friction

Drainage is Critical

**Economics** 

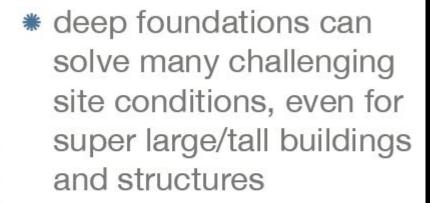

## wrap up

FOUNDATION DESIGN AND SELECTION IS A CRITICAL ACTIVITY IN PROJECTS THAT MUST OCCUR AT THE EARLY STRATEGIC LEVELS TO TEST THE VIABILITY OF THE PROJECT

- \* shallow foundations are preferred as there is less risk and expense
- \* underpinning is a common exercise in urban environments where adjacencies are unavoidable.
